

**Optrics** will provide your organization the assurance it needs to identify new ways that attackers will use to exploit and compromise sensitive data.

Our penetration testing service (through our partnership with Vonahi) allows your business to perform ongoing security assessments of your environment without the challenges of traditional security assessments. These challenges include high costs, lack of flexibility in scheduling, long turnaround on reports, lack of comprehensiveness, and labor-intensive security assessments. By addressing these concerns, we help you add offensive security to strengthen your defenses as well as improve your detection and monitoring controls.

**Optrics Engineering** provides your team with a dashboard that allows them to track the penetration test and its activities in real-time. As more issues are identified and more information about the network is learned, information within the portal is updated to reflect the latest information, activities, and security threats identified from our cybersecurity team.

### **Below are 5 key features of our Penetration Testing services:**

Organizations can perform penetration tests at any time they want, however often they want.

Penetration testing activities are tracked in real-time and can be used for improvement of detection and monitoring controls.

Email notifications can be sent out to establish up-to-date progress and activities.

Turnaround time from start to finish is significantly faster while providing the same or more results than traditional penetration tests.

Deliverable packages contain more comprehensive details to help organizations understand, mitigate, and attempt to reproduce threats identified found in their network.
